

Project visual representation

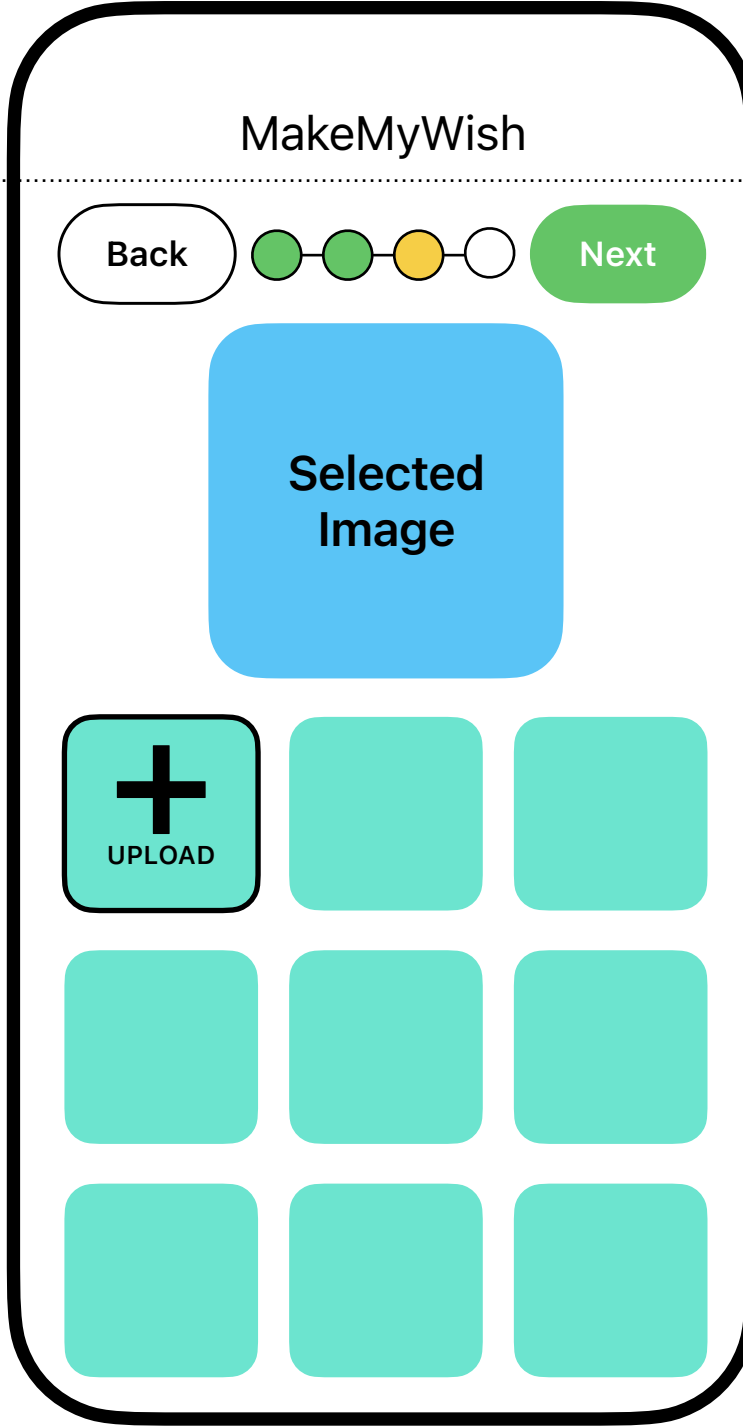

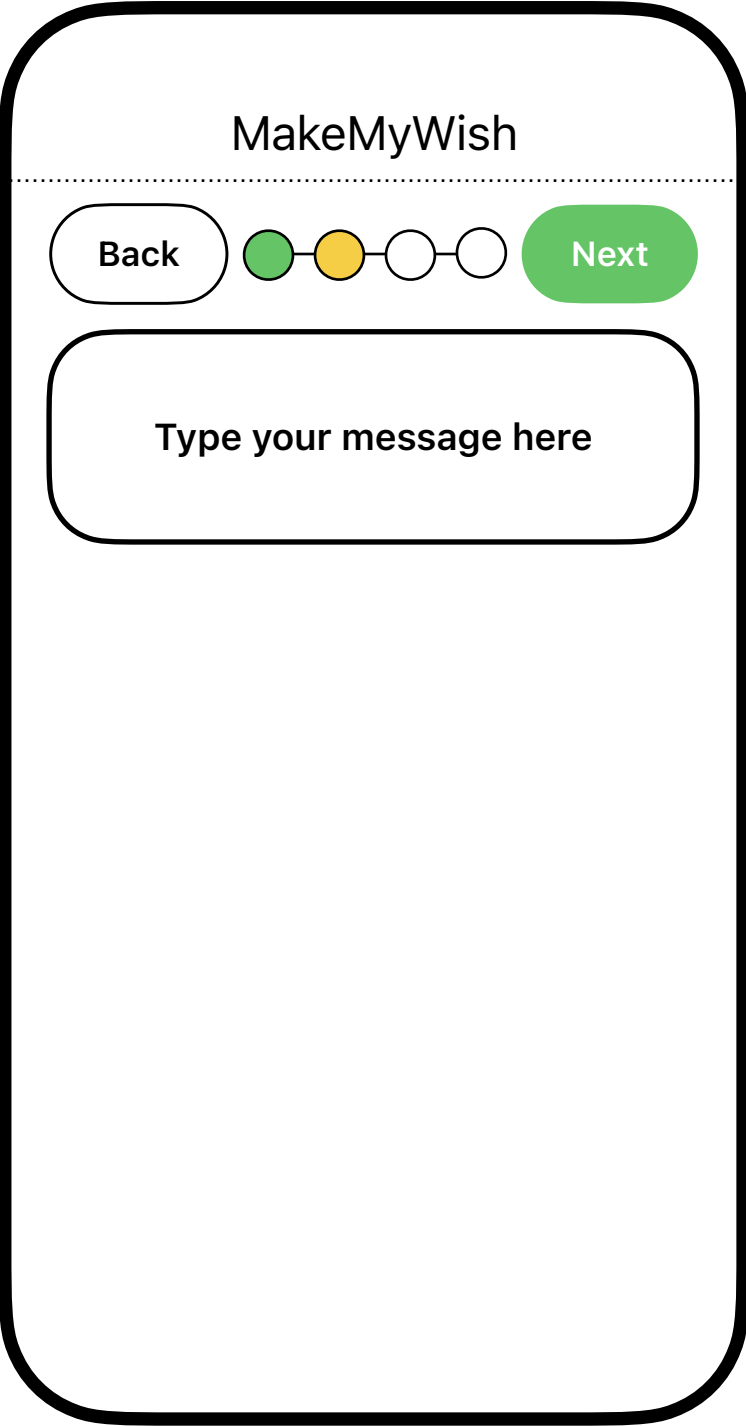

- Data on this screen comes directly from a json file stored on s3, for ex: homescreenData.json
- It will have list of festivals, featured festivals and other necessary details about the festivals like icon url, date, festival-id etc.
- Sorting and search filtering etc happens on the frontend side for now.

- All our templates must have icons.
- Data on this page comes from backend. Need to have few templates mapped to each festival.
- Template here just a wish that has been already created by us.

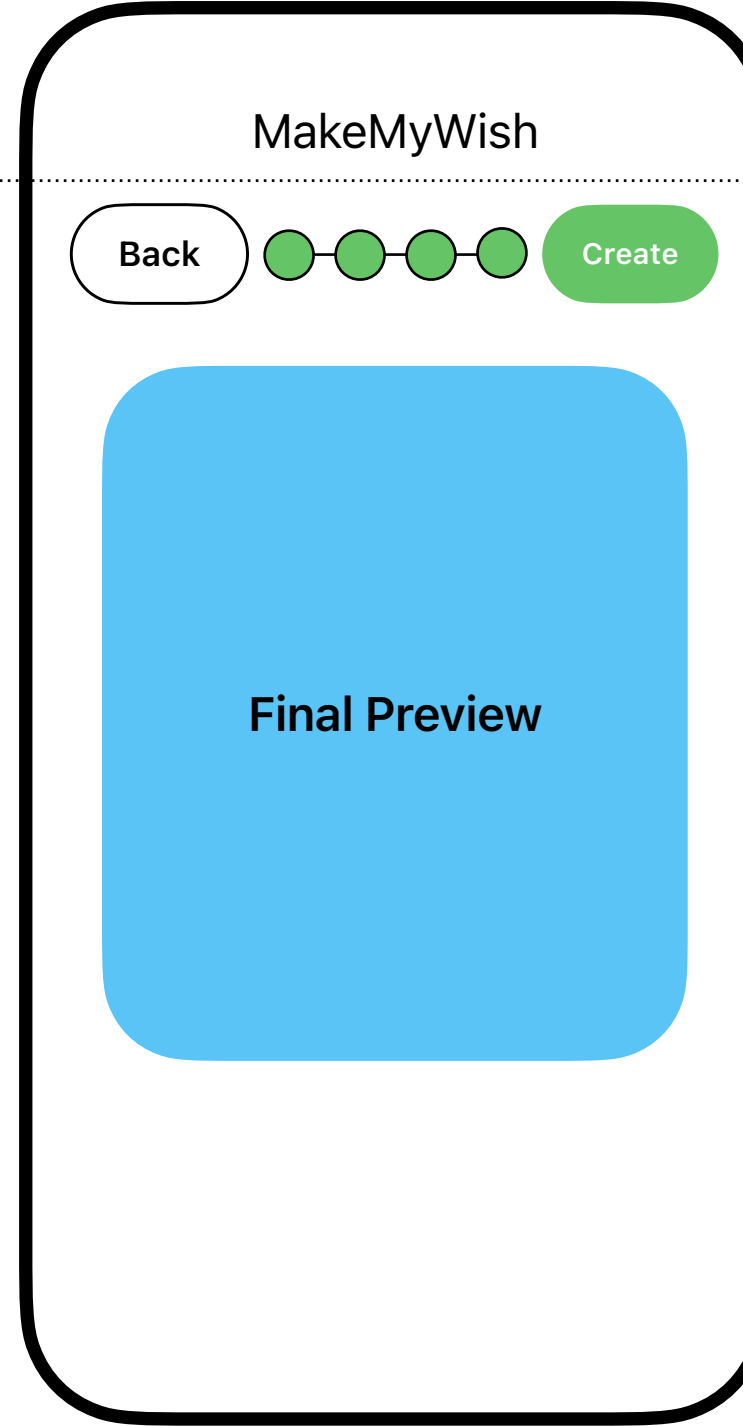

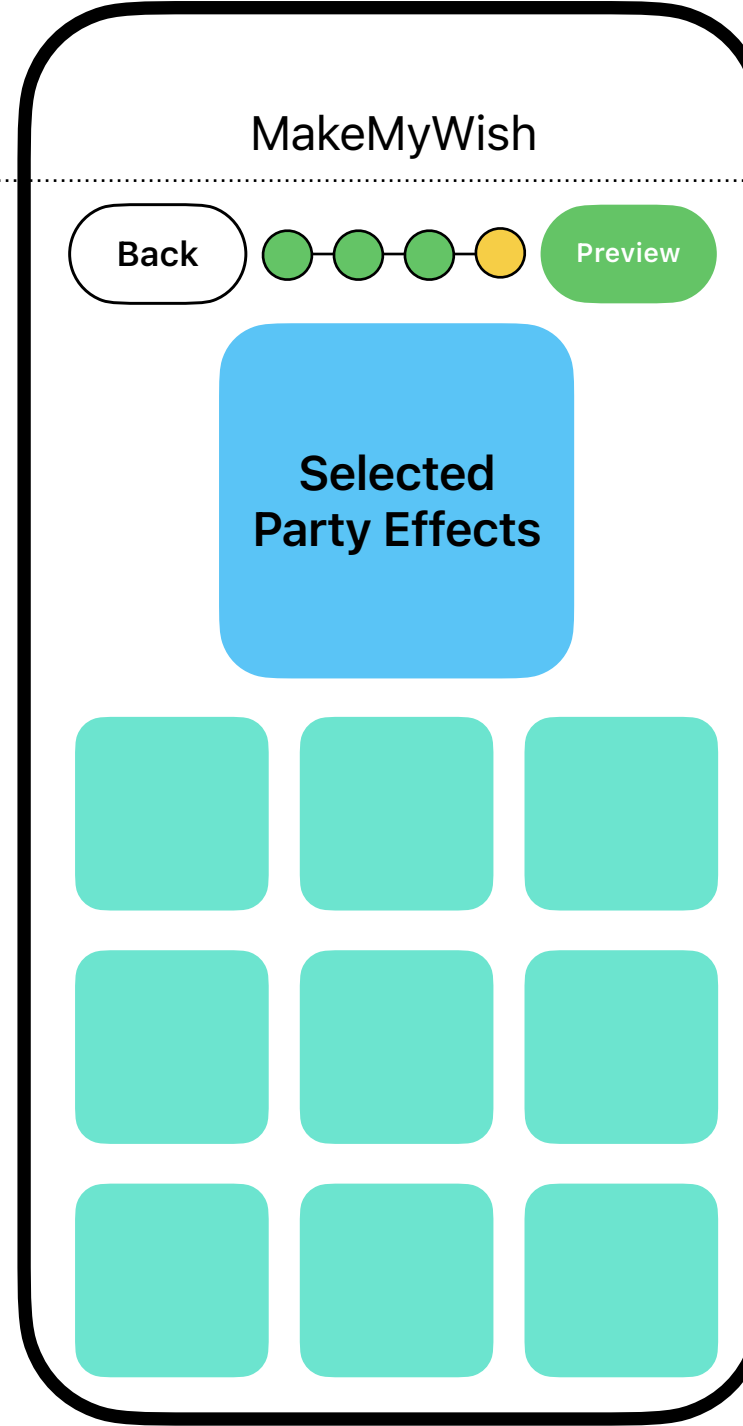

- We can this of what additional things can be added here or what to do with this empty space

- User uploaded image will be stored on s3.
- A cron job will be set to delete these images upon expiration.

- List of generic files can be stored in a json on s3, as it'll be static data for all users and for all festivals.

- Party effects, mostly are animation files and will be generic. Hence no festival mapping is needed for this.

- Icons of listed social media apps and a default share that I guess device can handle.
